Buffer capacity falls to 33% of the maximum value at $\text{pH} = \text{pK}_a \pm 1$, to 10% at $\text{pH} = \text{pK}_a \pm 1.5$ and to 1% at $\text{pH} = \text{pK}_a \pm 2$. For this reason the most useful range is approximately $\text{pK}_a \pm 1$. When choosing a buffer for use at a specific pH, it should have a pK_a value as close as possible to that pH.

the pH of a Buffer Solution after Addition of a Small Amount of Strong Base. When a strong base (OH^-) is added to a buffer solution, the hydroxide ions are consumed by the weak acid forming water and the weaker conjugate base of the acid. The amount of the weak acid decreases while the amount of the conjugate base increases.
