Basic Mechanics of Materials: Computing Stresses in Columns. Knowing how to compute the stress in a column (compression member) is a basic point of knowledge in mechanics of materials. Determine if the column is ' short, slender, or intermediate by computing its maximum slenderness ratio (KL/r). For short columns, the stress of a member in compression is the basic axial stress formulation.

Contact mechanics is the study of the deformation of solids that touch each other at one or more points. A central distinction in contact mechanics is between stresses acting perpendicular to the contacting bodies' surfaces (known as the normal direction) and frictional stresses acting tangentially between the surfaces. This page focuses mainly on the normal direction, i.e. on frictionless ...

Therefore, criterion for simple solid solutions in HEAs should be the ΔH_{mix} and δ values falling into the upper-left district in Fig. 2.4 under the fulfillment of high entropy of mixing ($\Delta S_{\text{mix}} = 1.61R$). To be specific, the quantitative criterion for the formation of simple solid solutions is: $\Delta S_{\text{mix}} > 13.38 \text{ J / K mol}$, $-10 \text{ kJ / mol} < \Delta H \dots$
