Cyclic voltammetry determines first and second oxidation potentials of conducting diamines. The results show that unsubstituted and methyl-substituted molecules conduct electricity in partially positively charged states, reflecting electron delocalization at the wire–gold junctions, but with electron-withdrawing substituents, the molecular wires are closer to uncharged as conductors ...

Reactive cellular metabolites can modify macromolecules and form adducts known as nonenzymatic covalent modifications (NECMs). The dissection of the mechanisms, regulation, and consequences of NECMs, such as glycation, has been challenging due to the complex and often ambiguous nature of the adducts formed. Specific chemical tools are required to directly track the formation of these ...
