Fuzzy logic, in mathematics, a form of logic based on the concept of a fuzzy set. Membership in fuzzy sets is expressed in degrees of truth—i.e., as a continuum of values ranging from 0 to 1.

Fuzzy sets can be considered as an extension and gross oversimplification of classical sets. It can be best understood in the context of set membership.

Basically it allows partial membership which means that it contain elements that have varying degrees of membership in the set.

Fuzzy mathematics forms a branch of mathematics related to fuzzy set theory and fuzzy logic. It started in 1965 after the publication of Lotfi Asker Zadeh 's seminal work Fuzzy sets. A fuzzy subset  $A$  of a set  $X$  is a function  $A: X \rightarrow L$ , where  $L$  is the interval  $[0,1]$ . This function is also called a membership function.

In mathematics, fuzzy sets (a.k.a. uncertain sets) are somewhat like sets whose elements have degrees of membership. Fuzzy sets were introduced independently by Lotfi A. Zadeh and Dieter Klaua [] in 1965 as an extension of the classical notion of set. At the same time, Salii (1965) defined a more general kind of structure called an L-relation, which he studied in an abstract algebraic context.

Moreover, the central role of fuzzy set theory leads to the problem of providing foundations of mathematics based on fuzzy logic. This is particularly important in view of the early criticism of fuzzy logic as lacking a solid mathematical foundation.

The most fundamental assumption of (mainstream) mathematical fuzzy logic is that connectives are to be interpreted truth-functionally over the set of truth-degrees. Such truth-functions are assumed to behave classically on the extremal values 0 and 1.

In Fuzzy Sets and Fuzzy Logic, the concept of possibility measure is introduced via Dempster-Shafer's theory of evidence. This is motivated by the observation that in the case of nested focal sets in the Dempster-Sbafer theory, possibility measure coincides with plausibility measure.
