the metal plates. The choice of oil was important because most oils would evaporate under the heat of the light source, causing the drop to change mass throughout the experiment.

The Millikan Oil Drop Chemistry Experiment

The Oil Drop
Experiment In 1909,
Robert Millikan and

Read Online Millikan Oil Drop Lab Activity

Harvey Fletcher conducted the oil drop experiment to determine the charge of an electron. They suspended tiny charged droplets of oil between two metal electrodes by balancing downward gravitational force with upward drag and electric forces.

Chemistry

Millikan Oil Drop Lab. In this lab you will be looking for oil drops that can caught in the electric field between two capacitor plates. Some drops will fall out of your field of view as the gravitational force on them is larger than the electric force. Other drops will rise out of your field of view as the gravitational force is too small for ...

Millikan Oil Drop

Lab Activity

Millikan's Apparatus
Millikan's experiment is based around observing charged oil droplets in free fall and in the presence of an electric field. A fine mist of oil is sprayed across the top of a perspex cylinder with a small 'chimney' that leads down to the cell (if the cell valve is open).

Overview: In this activity the students are to find the mass of the object that is common to a set of envelopes. This activity is analogous to the Millikan oil drop experiment. The Millikan Experiment and the Standard Model both require that students recognize that charge and matter are observed in discrete units.
