Two Sum in Python. Python Server Side ... Here we will take one assumption, that is always there will be one unique solution in the array, so no two set of indices for same target will be there. For an example, suppose the array is like A = [2, 8, 12, 15], and the target sum is 20. Then it will return indices 1 and 2, as A[1] + A[2] = 20.
